Windows Screen and Power Settings

If your computer goes to sleep more quickly than you like or prompts you to log in more frequently than you like this article is for you!

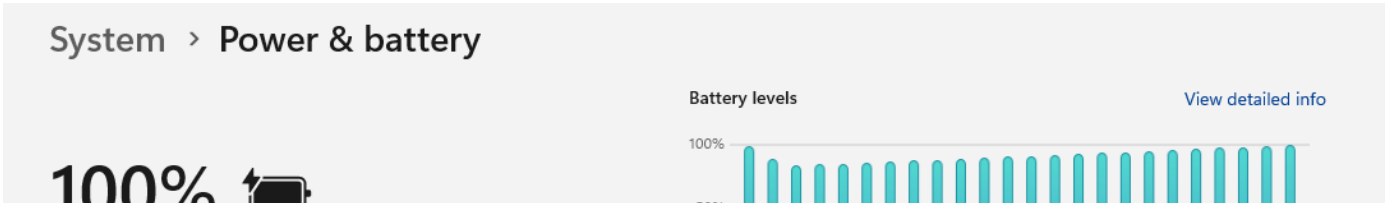

Press the Windows key on the keyboard and type sleep

Sleep 1783×790 64.3 KB

Click on Power, sleep, and battery settings.

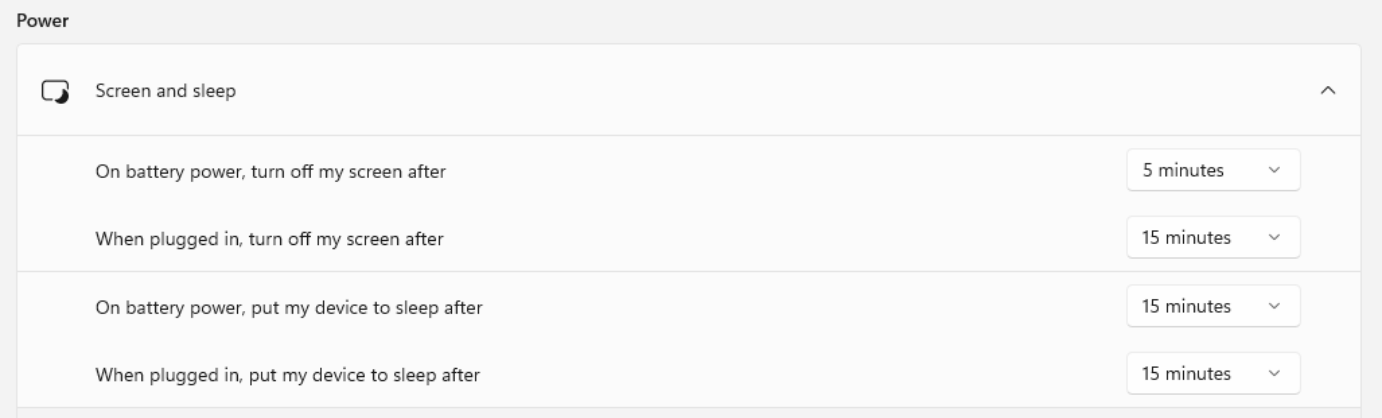

The Power and Battery window will open.

Sleep 21082×753 31.5 KB

Click on Screen and sleep

The default times for turning the screen off and putting the device to sleep are shown while on battery and plugged in.

Sleep 31027×311 6.99 KB

Increase these times as you see fit! There is no save button, the settings will be applied as you select them.

A couple of items to be aware of:

1. Increasing the time of the “On battery power” options will decrease the time the computer can run while on battery power.
2. Remember to press the Windows button and L to lock the computer if it is unattended.
